## Columbia University IEOR4742 – Deep Learning for OR & FE (Hirsa) Assignment 1 – Due 8:40 am on Tuesday Oct 1st, 2019

**Problem 1 (Linear Classification Example):** Assume  $\Omega = [-1, 1] \times [-1, 1]$ . Define the following two curves in the two-dimensional space  $\Omega$ 

$$y_1 = -0.6\sin(\pi/2 + 3x) - 0.35$$
  
 $y_2 = -0.6\sin(\pi/2 + 3x) + 0.25$ 

- (a) In the first trial, simply separate two classes of data (two curves) by dividing them with a straight line.
- (b) Now transforming the space  $\Omega$  using the following transformation to create new presentation for the space, that is for every grid point in  $\Omega$  we do

$$\hat{x} = \tanh(w_{11}x + w_{21}y + b1)$$
  
 $\hat{y} = \tanh(w_{12}x + w_{22}y + b2)$ 

for some parameter set  $(w_{11}, w_{12}, w_{21}, w_{22}, b_1, b_2)$ . One can run the following nested loop for the parameter set to visualize the transformed topology:

It is clear there are infinitely many presentations. We are looking for the one such that one can just draw a line through the transformed data without crossing any of the transformed curves. Note that we seek  $\mathbf{w} = (a, b, c)$  as well as  $(w_{11}, w_{12}, w_{21}, w_{22}, b_1, b_2)$  (9 parameters) such that

$$\mathbf{w}^{\top} \eta \ge 0 \text{ when } t = +1$$
  
 $\mathbf{w}^{\top} \eta < 0 \text{ when } t = -1$ 

or equivalently

$$\mathbf{w}^{\top} \eta_i t_i \geq 0 \ \forall j$$

thus we seek to minimize

$$-\sum_{j\in\mathcal{A}}\mathbf{w}^{\top}\eta_{j}t_{j}\geq0\quad\forall j$$

where  $\mathcal{A}$  is the set of mis-classified inputs. Here  $\eta_j = (\hat{x}_j, \hat{y}_j, 1)$ .

(c) Use various different objective functions (one of which provided in part (b)) as well as optimization routines to find the optimal parameter set

**Problem 2 (Linear Classification Example):** Assume  $\Omega = [-80, 80] \times [-80, 80]$ . Define the following two spirals in the two-dimensional space  $\Omega$ 

$$x_1 = r_1 \cos(\phi_1)$$
  
$$y_1 = r_1 \sin(\phi_1)$$

$$x_2 = r_2 \cos(\phi_2)$$
  
$$y_2 = r_2 \sin(\phi_2)$$

where

$$r_1 = 50 + 0.20t$$

$$r_2 = 30 + 0.40t$$

$$\phi_1 = -0.06t + 3$$

$$\phi_2 = -0.08t + 2$$

and  $t = 1, 2, \dots, 1000$ 

- (a) plot the two spirals
- (b) build a feedforward network to do the linear classification

Problem 3 (Impact of non-linear activation functions on Learning): Show that a feed-forward neural network with linear activation function and any number of hidden layers is equivalent to just a linear neural neural network with no hidden layer.
